The Veterinary Diagnostic Laboratory has an extensive data base with a wealth of interesting cases that are waiting to be explored and researched. Particular interests of mine are neoplastic disease in general, neoplasms of the lymphatics and blood vessels (lymphangioma, lymphangiosarcoma, hemangioma, and hemangiosarcoma) and their characterization by immunohistochemistry in particular, as well as diseases of camelids and of the skin. I am open to explore other areas and ideas. Collaborations with colleagues at the Federal Research Center in Germany (Friedrich Loeffler Institut), the Zoo in Pretoria, South Africa, and the veterinary school in Porto Alegre, Brazil are also options (travel at student's expense).
